Today's Lecture

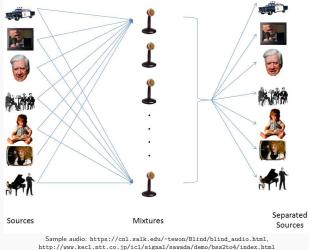

Unsupervised Learning (Part III)

- Independent Component Analysis (ICA)
- Canonical Correlation Analysis (CCA)

Independent Component Analysis

The cocktail party problem

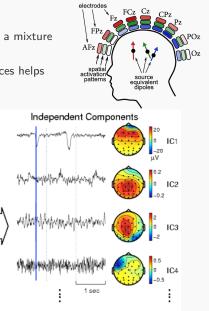

- n microphones at different locations of the room, each recording a mixture of n sound sources
- How to "unmix" the sound mixtures?

EEG Analysis

- Electrodes on patient scalp measure a mixture of different brain activations
- Finding independent activation sources helps removing artifacts in the signal

EEG Scalp Channels

scalp maps

VEOG

FC5 water

Cz Mym

activations

unmixing

(W)

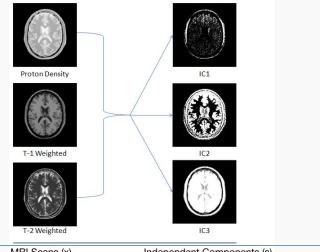

100 µV

-20

uV

Brian imaging

- Different brain matters: gray matter, white matter, cerebrospinal fluid (CSF), fat, muscle/skin, glial matter etc.
- An MRI scan is a mixture of magnetic response signals from different brain matters

MRI Scans (x)

Learning And energy and ent Components (s)

Problem Model

Case: n = 2

- ▶ Observed random variables: *x*₁, *x*₂
- ▶ Independent sources: $s_1, s_2 \in \mathbb{R}$

 $x_1 = a_{11}s_1 + a_{12}s_2$ $x_2 = a_{21}s_1 + a_{22}s_2$

Problem Model

Case: n = 2

- ▶ Observed random variables: *x*₁, *x*₂
- ▶ Independent sources: $s_1, s_2 \in \mathbb{R}$

 $x_1 = a_{11}s_1 + a_{12}s_2$ $x_2 = a_{21}s_1 + a_{22}s_2$

A is called the **mixing matrix**

$$x = As$$

Problem Model

Case: n = 2

- Observed random variables: x₁, x₂
- ▶ Independent sources: $s_1, s_2 \in \mathbb{R}$

 $x_1 = a_{11}s_1 + a_{12}s_2$ $x_2 = a_{21}s_1 + a_{22}s_2$

A is called the mixing matrix

$$x = As$$

The blind source separation (cocktail party) problem

Given repeated observation $\{x^{(i)}; i = 1, ..., m\}$, recover sources $s^{(i)}$ that generated the data $(x^{(i)} = As^{(i)})$

Independent Component Analysis (ICA)

The blind source separation (cocktail party) problem

Given repeated observation $\{x^{(i)}; i = 1, ..., m\}$, recover sources $s^{(i)}$ that generated the data $(x^{(i)} = As^{(i)})$

Let $W = A^{-1}$ be the **unmixing matrix** Goal of ICA: Find W, such that given $x^{(i)}$, the sources can be recovered by $s^{(i)} = Wx^{(i)}$

$$V = \begin{bmatrix} -w_1^T - \\ \vdots \\ -w_n^T - \end{bmatrix}$$

Is W unique for a given set of observations ?

Assume data is non Gaussian, ICA has two ambiguities:

Variance of the sources: We can fix the magnitude of s_i by setting $\mathbb{E}[s_i^2] = 1$

Assume data is non Gaussian, ICA has two ambiguities:

- ► Variance of the sources: We can fix the magnitude of s_i by setting E[s_i²] = 1
- Order of the sources s₁,..., s_n: Let P be a permutation matrix, then we have x = APP⁻¹s.

Assume data is non Gaussian, ICA has two ambiguities:

- ► Variance of the sources: We can fix the magnitude of s_i by setting E[s_i²] = 1
- Order of the sources s₁,..., s_n: Let P be a permutation matrix, then we have x = APP⁻¹s.

Assume data is non Gaussian, ICA has two ambiguities:

- ► Variance of the sources: We can fix the magnitude of s_i by setting E[s_i²] = 1
- Order of the sources s₁,..., s_n: Let P be a permutation matrix, then we have x = APP⁻¹s.

Why is Gaussian data problematic?

Assume data is non Gaussian, ICA has two ambiguities:

- Variance of the sources: We can fix the magnitude of s_i by setting 𝔼[s_i²] = 1
- Order of the sources s₁,..., s_n: Let P be a permutation matrix, then we have x = APP⁻¹s.

Why is Gaussian data problematic?

- The distribution of any rotation of Gaussian x has the same distribution as x.
- As long as at least one s_j is non-Gaussian, given enough data, we can recover the n independent sources.

Densities and Linear Transformations

Theorem 1

If random vector s has density p_s , and x = As for a square, invertible matrix A, then the density of x is

 $p_x(x) = p_s(Wx) \cdot |W|$

where $W = A^{-1}$.

The joint distribution of *independent* sources $s = \{s_1, \ldots, s_n\}$:

$$p(s) = \prod_{j=1}^n p_s(s_j)$$

The joint distribution of *independent* sources $s = \{s_1, \ldots, s_n\}$:

$$p(s) = \prod_{j=1}^n p_s(s_j)$$

The density of observation x = As is:

$$p_{x}(x) = p_{s}(s)|W| = \prod_{j=1}^{n} p_{s}(s_{j})|W| = \prod_{j=1}^{n} p_{s}(w_{j}^{T}x)|W|$$

The joint distribution of *independent* sources $s = \{s_1, \ldots, s_n\}$:

$$p(s) = \prod_{j=1}^n p_s(s_j)$$

The density of observation x = As is:

$$p_x(x) = p_s(s)|W| = \prod_{j=1}^n p_s(s_j)|W| = \prod_{j=1}^n p_s(w_j^T x)|W|$$

Choose the sigmoid function $g(s) = rac{1}{1+e^{-s}}$ as the *non-Gaussian* cdf for p_s , then

$$p_s(s) = g'(s)$$

The joint distribution of *independent* sources $s = \{s_1, \ldots, s_n\}$:

$$p(s) = \prod_{j=1}^n p_s(s_j)$$

The density of observation x = As is:

$$p_x(x) = p_s(s)|W| = \prod_{j=1}^n p_s(s_j)|W| = \prod_{j=1}^n p_s(w_j^T x)|W|$$

Choose the sigmoid function $g(s) = rac{1}{1+e^{-s}}$ as the *non-Gaussian* cdf for p_s , then

$$p_s(s)=g'(s)$$

This appears to be a heuristic choice, yet it can be justified rigorously in other interpretations.

Given i.i.d. training samples $\{x^{(1)},\ldots,x^{(m)}\}$, the log likelihood is

$$I(W) = \sum_{i=1}^{m} log(p_x(x^{(i)})) = \sum_{i=1}^{m} log(\prod_{j=1}^{n} p_s(w_j^T x)|W|)$$
$$= \sum_{i=1}^{m} \left(\sum_{j=1}^{n} \log g'(w_j^T x^{(i)}) + \log |W|\right)$$

Given i.i.d. training samples $\{x^{(1)}, \ldots, x^{(m)}\}$, the log likelihood is

$$\begin{split} l(W) &= \sum_{i=1}^{m} log(p_{x}(x^{(i)})) = \sum_{i=1}^{m} log(\prod_{j=1}^{n} p_{s}(w_{j}^{T}x)|W|) \\ &= \sum_{i=1}^{m} \left(\sum_{j=1}^{n} \log g'(w_{j}^{T}x^{(i)}) + \log |W| \right) \end{split}$$

Stochastic gradient ascent learning rule for sample $x^{(i)}$:

$$W := W + \alpha \left(\begin{bmatrix} 1 - 2g(w_1^T x^{(i)}) \\ \vdots \\ 1 - 2g(w_n^T x^{(i)}) \end{bmatrix} x^{(i)^T} + (W^T)^{-1} \right)$$

Check this at home!

Theoretical Motivation of ICA

 Originally proposed by Jutten & Herault (1991) ¹90 years later than PCA

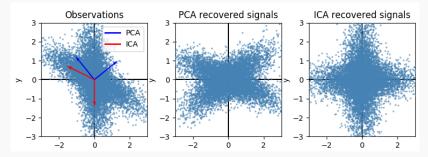

• Equivalent to learning projection directions w_1, \ldots, w_n that

- maximize the sum of non-gaussianity of the projected signals
- minimize the mutual information of the projected signals

under the constraint that $w_1^T x, \ldots, w_n^T x$ are uncorrelated.²

¹Christian Jutten, Jeanny Herault, Blind separation of sources, part I: An adaptive algorithm based on neuromimetic architecture, Signal Processing, Vol 24:1, 1991 ²Hyvärinen, Aapo, and Erkki Oja. "Independent component analysis: algorithms and applications." Neural networks 13.4-5 (2000): 411-430.

ICA vs PCA

PCA	ICA
approximately Gaussian data	non-Gaussian data
removes correlation (low order	removes correlations and higher
dependence)	order dependence
ordered importance	all components are equally impor-
	tant
orthogonal	not orthogonal

Canonical Correlation Analysis

Canonical Correlation Analysis

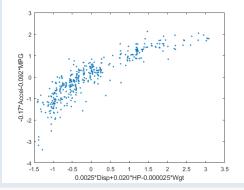

Canonical correlation analysis (CCA) finds the associations among two sets of variables.

Canonical Correlation Analysis

Canonical correlation analysis (CCA) finds the associations among two sets of variables.

Example: two sets of measurements of 406 cars:

- Specification: Engine displacement (Disp), horsepower (HP), weight (Wgt)
- Measurement: Acceleration (Accel), MPG

find important features that explain covariation between sets of variables

Random vectors
$$X = \begin{bmatrix} x_1 \\ \vdots \\ x_{n_1} \end{bmatrix}$$
 and $Y = \begin{bmatrix} y_1 \\ \vdots \\ y_{n_2} \end{bmatrix}$

• Covariance matrix $\Sigma_{XY} = cov(X, Y)$

Random vectors
$$X = \begin{bmatrix} x_1 \\ \vdots \\ x_{n_1} \end{bmatrix}$$
 and $Y = \begin{bmatrix} y_1 \\ \vdots \\ y_{n_2} \end{bmatrix}$

- Covariance matrix $\Sigma_{XY} = cov(X, Y)$
- CCA finds vectors a and b such that the random variables a^TX and b^TY maximize the correlation

$$\rho = corr(a^T X, b^T Y)$$

Random vectors
$$X = \begin{bmatrix} x_1 \\ \vdots \\ x_{n_1} \end{bmatrix}$$
 and $Y = \begin{bmatrix} y_1 \\ \vdots \\ y_{n_2} \end{bmatrix}$

- Covariance matrix $\Sigma_{XY} = cov(X, Y)$
- CCA finds vectors a and b such that the random variables a^TX and b^TY maximize the correlation

$$\rho = corr(a^T X, b^T Y)$$

• $U = a^T X$ and $V = b^T Y$ are called **the first pair of canonical** variables

Random vectors
$$X = \begin{bmatrix} x_1 \\ \vdots \\ x_{n_1} \end{bmatrix}$$
 and $Y = \begin{bmatrix} y_1 \\ \vdots \\ y_{n_2} \end{bmatrix}$

- Covariance matrix $\Sigma_{XY} = cov(X, Y)$
- CCA finds vectors a and b such that the random variables a^TX and b^TY maximize the correlation

$$\rho = corr(a^T X, b^T Y)$$

- $U = a^T X$ and $V = b^T Y$ are called **the first pair of canonical** variables
- Subsequent pairs of canonical variables maximizes ρ while being uncorrelated with all previous pairs

Review: Singular Value Decomposition

A generalization of eigenvalue decomposition to rectangle $(m \times n)$ matrices M.

$$M = U\Sigma V^{T} = \sum_{i=1}^{r} \sigma_{i} u_{i} v_{i}^{T}$$

▶ $U \in \mathbb{R}^{m \times m}$, $V \in \mathbb{R}^{n \times n}$ are orthogonal matrices

► $\Sigma \in \mathbb{R}^{m \times n}$ is a rectangular diagonal matrix. Examples:

$$\Sigma = \begin{bmatrix} \sigma_1 & 0 & 0 \\ 0 & \sigma_2 & 0 \\ 0 & 0 & \sigma_3 \\ 0 & 0 & 0 \end{bmatrix} \quad \Sigma = \begin{bmatrix} \sigma_1 & 0 & 0 & 0 \\ 0 & \sigma_2 & 0 & 0 \\ 0 & 0 & \sigma_3 & 0 \end{bmatrix}$$

Diagonal entries $\sigma_1 \ge \sigma_2 \ge \cdots \ge \sigma_k$, $k = \min(n, m)$ are called singular values of M.

Review: Singular Value Decomposition

A non-negative real number σ is a singular value for $M \in \mathbb{R}^{m \times n}$ if and only if there exist unit-length $u \in \mathbb{R}^m$ and $v \in \mathbb{R}^n$ such that

 $Mv = \sigma u$ $M^{T}u = \sigma v$

u is called the left singular vector of $\sigma,$ v is called the right singular vector of σ

Review: Singular Value Decomposition

A non-negative real number σ is a singular value for $M \in \mathbb{R}^{m \times n}$ if and only if there exist unit-length $u \in \mathbb{R}^m$ and $v \in \mathbb{R}^n$ such that

 $Mv = \sigma u$ $M^{T} u = \sigma v$

u is called the left singular vector of $\sigma,$ v is called the right singular vector of σ

Connection to eigenvalue decomposition

Given SVD of matrix $M = U \Sigma V^T$,

• $M^T M = (V\Sigma^T U^T)(U\Sigma V^T) = V(\Sigma^T \Sigma)V^T \leftarrow v_i$ is an eigenvector of $M^T M$ with eigenvalue σ_i^2

•
$$MM^T = (U\Sigma V^T)(V^T\Sigma^T U) = U(\Sigma\Sigma^T)U^T \leftarrow u_i$$
 is an eigenvector of MM^T with eigenvalue σ_i^2

CCA Derivations

The original problem:

$$(a_1, b_1) = \operatorname*{argmax}_{a \in \mathbb{R}^{n_1}, b \in \mathbb{R}^{n_2}} corr(a^T X, b^T Y)$$
(1)

CCA Derivations

The original problem:

$$(a_1, b_1) = \operatorname*{argmax}_{a \in \mathbb{R}^{n_1}, b \in R^{n_2}} \operatorname{corr}(a^T X, b^T Y)$$
(1)

Assume $\mathbb{E}[x_1] = \cdots = \mathbb{E}[x_{n_1}] = \mathbb{E}[y_1] = \cdots = \mathbb{E}[y_{n_2}] = 0$,

$$corr(a^{T}X, b^{T}X) = \frac{\mathbb{E}[(a^{T}X)(b^{T}Y)^{T}]}{\sqrt{\mathbb{E}}[(a^{T}X)^{2}]\mathbb{E}[(a^{T}Y)^{2}]}$$
$$= \frac{a^{T}\Sigma_{XY}b}{\sqrt{a^{T}\Sigma_{XX}a}\sqrt{b^{T}\Sigma_{YY}b}}$$

The original problem:

$$(a_1, b_1) = \operatorname*{argmax}_{a \in \mathbb{R}^{n_1}, b \in R^{n_2}} \operatorname{corr}(a^T X, b^T Y)$$
(1)

Assume $\mathbb{E}[x_1] = \cdots = \mathbb{E}[x_{n_1}] = \mathbb{E}[y_1] = \cdots = \mathbb{E}[y_{n_2}] = 0$,

$$corr(a^{T}X, b^{T}X) = \frac{\mathbb{E}[(a^{T}X)(b^{T}Y)^{T}]}{\sqrt{\mathbb{E}[(a^{T}X)^{2}]\mathbb{E}[(a^{T}Y)^{2}]}}$$
$$= \frac{a^{T}\Sigma_{XY}b}{\sqrt{a^{T}\Sigma_{XX}a}\sqrt{b^{T}\Sigma_{YY}b}}$$

(1) is equivalent to:

$$\begin{aligned} (a_1, b_1) &= \operatorname{argmax} \quad a^T \Sigma_{XY} b \\ a &\in \mathbb{R}^{n_1}, b \in R^{n_2} \\ a^T \Sigma_{XX} a &= b^T \Sigma_{YY} b = 1 \end{aligned}$$
 (2)

Define
$$\Omega \in R^{n_1 \times n_2}$$
, $c \in \mathbb{R}^{n_1}$ and $d \in \mathbb{R}^{n_2}$,

$$\Omega = \sum_{XX}^{-\frac{1}{2}} \sum_{XY} \sum_{YY}^{-\frac{1}{2}} c_{XY} \sum_{YY}^{-\frac{1}{2}} c_{YY}$$
$$c = \sum_{XX}^{\frac{1}{2}} a$$
$$d = \sum_{YY}^{\frac{1}{2}} b$$

(2) can be written as

$$(c_1, d_1) = rgmax c^T \Omega d$$
 (3)
 $c \in \mathbb{R}^{n_1}, d \in \mathbb{R}^{n_2}$
 $||c||^2 = ||d||^2 = 1$

Define
$$\Omega \in R^{n_1 \times n_2}$$
, $c \in \mathbb{R}^{n_1}$ and $d \in \mathbb{R}^{n_2}$,

$$\Omega = \sum_{XX}^{-\frac{1}{2}} \sum_{XY} \sum_{YY}^{-\frac{1}{2}}$$
$$c = \sum_{XX}^{\frac{1}{2}} a$$
$$d = \sum_{YY}^{\frac{1}{2}} b$$

(2) can be written as

$$(c_1, d_1) = rgmax c^T \Omega d$$
 (3)
 $c \in \mathbb{R}^{n_1}, d \in \mathbb{R}^{n_2}$
 $||c||^2 = ||d||^2 = 1$

 (c_1, d_1) can be solved by SVD, then the first pair of canonical variables are

$$a_1 = \Sigma_{XX}^{-rac{1}{2}} c_1, \quad b_1 = \Sigma_{YY}^{-rac{1}{2}} d_1$$

$$(c_1, d_1) = egin{argmax}{c \in \mathbb{R}^{n_1}, d \in \mathbb{R}^{n_2}} \ ||c||^2 = ||d||^2 = 1 \end{array}$$

Proposition 1

 c_1 and d_1 are the left and right unit singular vectors of Ω with the largest singular value.

$$egin{aligned} &(c_1,d_1) = rgmax & c^T \Omega d \ & c \in \mathbb{R}^{n_1}, d \in \mathbb{R}^{n_2} \ & ||c||^2 = ||d||^2 = 1 \end{aligned}$$

Proposition 1

 c_1 and d_1 are the left and right unit singular vectors of Ω with the largest singular value.

Theorem 2

 c_i and d_i are the left and right unit singular vectors of Ω with the ith largest singular value.

CCA Algorithm

Input: Covariance matrices for centered data X and Y:

- $\blacktriangleright \Sigma_{XY}$, invertible Σ_{XX} and Σ_{YY}
- ▶ Dimension $k \leq \min(n_1, n_2)$

Output: CCA projection matrices A_k and B_k :

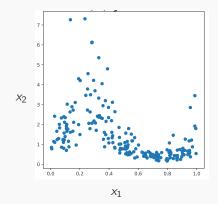

• Compute $\Omega = \sum_{XX}^{-\frac{1}{2}} \sum_{XY} \sum_{YY}^{-\frac{1}{2}}$

• Compute SVD decomposition of Ω

$$\Omega = \begin{bmatrix} | & \dots & | \\ c_1 & \dots & c_{n_1} \\ | & \dots & | \end{bmatrix} \begin{bmatrix} \sigma_1 & & \\ & \ddots & \\ & & \sigma_r \\ & 0 \end{bmatrix} \begin{bmatrix} -d_1^T - \\ \vdots \\ -d_{n_2}^T - \end{bmatrix}$$
$$\blacktriangleright A_k = \sum_{XX}^{-\frac{1}{2}} [c_1, \dots, c_k] \text{ and } B_k = \sum_{YY}^{-\frac{1}{2}} [d_1, \dots, d_k]$$

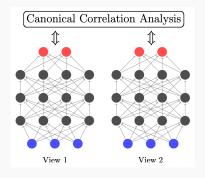

Discussion of CCA

- CCA only measures linear dependencies
- Non-linear generalizations:
 - Kernel CCA (KCCA)
 - Deep CCA (DCCA)
 - Maximal HGR Correlation

Non-linear dependency between x_1 and x_2

Deep Canonical Correlation Analysis (DCCA)

Andrew, Galen, et al. "Deep canonical correlation analysis." International conference on machine learning. PMLR, 2013.

Let
$$F_X = f(X; \theta_1)$$
, $G_Y = g(Y; \theta_2)$,

- Center features: $\bar{F}_X = F_X - \frac{1}{m}F_X^T \mathbf{1},$ $\bar{G}_Y = G_Y - \frac{1}{m}G_Y^T \mathbf{1}$
- Define CCA Loss:

$$\theta_{f}^{*}, \theta_{g}^{*} = \operatorname*{argmax}_{\theta_{f}, \theta_{g}} \mathcal{CCA}(\bar{F}_{X}, \bar{G}_{Y})$$

Maximize the total correlation of the top k components \implies Maximize the sum of top k singular values of $\Omega = \sum_{XX}^{-\frac{1}{2}} \sum_{XY} \sum_{YY}^{-\frac{1}{2}}$:

$$L_{CCA}(F_X,G_Y) = -tr(\Omega^T\Omega)^{\frac{1}{2}}$$

• Update
$$\frac{\delta L_{CCA}(F_X, G_Y)}{\delta F_X}, \frac{\delta L_{CCA}(F_X, G_Y)}{\delta G_Y}$$

Applications of CCA/DCCA

PCA, ICA and CCA

Linear Subspace Learning

Given high dimensional random vector \mathbf{x} , transform it to a low-dimensional vector \mathbf{y} through a projection matrix U:

$$y = U^T x$$

PCA, ICA and CCA

Linear Subspace Learning

Given high dimensional random vector \mathbf{x} , transform it to a low-dimensional vector \mathbf{y} through a projection matrix U:

$$y = U^T x$$

 PCA, ICA and CCA are all unsupervised linear subspace learning methods.

Name	What is U ?	goal	subspace
PCA	principal component	remove (low order) cor-	single
	(<i>U</i>)	relation	
ICA	unmixing matrix (W)	remove (high order) cor-	single
		relation	
CCA	canonical projection	maximize correlation	paired
	matrices (A, B)	between feature pairs
